
- command-line parameters are of two types: - to load the volume, you need to use the "-v" parameter; - to load the program, you need to use the "-p" parameter. Other parameters: - "?" - helps you to determine type of the hotkey, what is the purpose of the hotkey, - "*" - for all hotkeys except "Menu" hotkey, this parameter can be used to choose between values "playlist" or "menu" - "#" - for "menu" hotkey, this parameter can be used to choose between values "playlist" or "plugin" - "0" - only for this hotkey. Installation of the program: - (for Winamp user) - right-click on the hotkey (in the tray area), select 'open with' -> 'ZVolume Home' and choose "install". - (for non-Winamp user) - open the.zip archive with Winzip or similar application; - right-click on the.exe file and select "run as administrator" - click on "install" in the Winamp application; - double-click on the "ZVolume Home_2006.exe" file to start installation. Running ZVolume Home: - you can run the ZVolume Home with a simple click on the tray icon or with a hotkey (e.g. F1); - a tray menu (with a small icon) allows you to quit ZVolume Home; - a small system tray icon allows you to mute your sound using a simple double click; - a scrollbar allows you to adjust the volume level; - a mousewheel allows you to adjust the balance level; - the position of the pointer is indicated by the cursor. The cursor moves up or down depending on your mouse wheel roll. What's new in ZVolume Home 2006: (As of February 18, 2006) - support of bitmap skins with custom dimension - running of the application on Winamp 5.x and Winamp Portable 5.x - fixing the "error" on startup - a mouse wheel function for mute - support of up to 8 audio mixers - playback of the MP3 files that were saved to the CD - the ability to save the volume level on startup - the ability to export the current control window settings - the ability to export the ZVolume 70238732e0

This program enables you to make macros with a mouse or keyboard for frequently used or lengthy sequences of keystrokes, commands or even whole programs. This program can be used for such tasks as changing the name of a certain file or for executing a certain piece of code on a regular basis. You can use your keyboard to automate everything from creating an image file to mailing your newsletters to your entire friends and family. KEYMACRO is intended to be as easy to use as possible, so that your macros become a breeze. Just go to the "Settings" menu to configure it. Once the program is open, a "Macro Manager" tab will open on your screen. There you can add your own macros by simply dragging and dropping them from the application's file system into the macro section. You can also open files in this program by simply right-clicking on them

and choosing the option “Open in KEYMACRO”. You can even execute or paste a macro directly into the editor area. Every time you click the “Set” button on the keyboard (like the key “K”), a new macro will be triggered. To stop the current macro, just press the “Stop” button on the keyboard. There are two ways to add a file or folder to the macro list. First, you can drag it directly from the desktop to the macro list, or you can use the “Copy” option from the keyboard. Lastly, you can easily drag and drop any piece of code into the editor, including scripting languages such as VBScript, batch files, C or Perl. You can even drop one file or folder into the editor and create multiple macros from it. This is a really great feature if you’re a writer. Because there are no separate files or folders, you can easily move your macros between computers. You can even move the entire program or its editor folder to a new location. Furthermore, you can create backups of your macros so that you can easily restore them to a new location. KEYMACRO supports most standard keyboard layouts. If the layout isn’t in the list, simply click on the “Configure Keyboard Layout” button and choose your preferred layout. You can also have the program automatically set the layout to your currently selected keyboard when it launches. Speaking of your current keyboard layout, you can change it right from the Settings menu.
