Thyroid hormones are known to have multiple cardiac actions, but their role in the prognosis of postinfarction patients is unclear. We assessed the effect of thyroid status on early and long-term prognosis in 155 euthyroid women with a first acute myocardial infarction and followed for 4.6 +/- 2.1 years. Two-thirds of the women were taking thyroid hormones at admission, and 16% discontinued therapy before follow-up. High total T3 levels, but not T4, were associated with increased risk of cardiac events during follow-up, especially the composite of death and cardiac rehospitalization (p = 0.03 for the T3/T4 ratio). In the univariate analysis, smoking (p = 0.01) and heart failure (p = 0.05) were independent predictors of cardiac events, whereas thyroid hormones (p = 0.35) and beta-blockers (p = 0.09) were not. After adjustment for confounding factors, T3 was the only independent predictor of cardiac events (p = 0.02), whereas neither T4 nor the T3/T4 ratio were independently associated with events (p = 0.43 and p = 0.44, respectively). We conclude that thyroid hormones are associated with a worse prognosis in euthyroid women with a first myocardial infarction, independent of other cardiac risk factors. We also found that a high T3 level, but not the T3/T4 ratio, was a strong independent predictor of cardiac events.Cytokine release following substance P stimulation of the rat trigeminal

Jun 22, 2021 - One of the significant improvements in CC is that Adobe no longer separates files into different language sets - all languages are now included in one ... well, at least on most computers. What does this mean for CC users? Very little. All that's changed is that you now only have one set of languages (currently, only English), so you have to reinstall them every time you want to update CC. If you're working in more than one place, that's pretty good. After all, you can't switch from Chinese to Spanish, and therefore you have to restart CC after changing the language fffad4f19a
