

World Wire Cables
Cable Solutions

**Simplify Complex Wiring Layouts with
the Right Multicore Cable**

Running multiple signals or data connections through one installation gets messy fast. A multicore cable keeps several conductors inside one sheath, so you're pulling fewer cables and the layout stays cleaner from the start.

- **Designed for Real-World Data Applications**

At World Wire Cables, our multicore cable range is built around 300V flexible tinned copper conductors, PVC V-75 insulation, and PVC 4V-75 sheathing. The screened construction cuts down electromagnetic interference, which matters a lot in environments where signal integrity is critical. Colour-coded cores with a grey sheath make it easier to identify cables during installation and track them down later for maintenance.

These cables are built for limited-distance unbalanced core operations, including EIA RS423 and RS232 applications, making them a solid choice for control systems, industrial automation, and data processing setups.

- **Fewer Cables, Less Clutter**

Consolidating connections into a single multicore cable cuts routing complexity and the amount of space taken up inside conduit or cable trays. That directly affects installation time and how easy it is to find faults when a system needs attention later.

- **Consistent Supply for Projects of Any Size**

World Wire Cables has been supplying industrial electrical cables to the Australian market for more than two decades. Our multicore cable range is stocked to support

projects across commercial, industrial, and infrastructure sectors, and our team can help with product selection where specifications need clarification.

When your installation calls for an interference-resistant data cable that keeps your wiring layout clean, the right multicore cable makes a real difference from day one.
